

PRODUCT BRIEF / V4

# WarpDrive changes execution. ARES makes the capability deployable, governable and sellable.

The investment boundary is deliberate: WarpDrive is the private execution engine. ARES is the enterprise system and commercial product around it.

PUBLIC / PROVEN OR BOUNDED

| WARPDRIVE                                                                                                                                     | ARES                                                                                                                            |
|-----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Private execution engine. It seeks to reduce avoidable long-context model work and produce a smaller evidence-bearing workload for the model. | Enterprise control plane. It qualifies workloads, governs deployment, records evidence and carries the commercial relationship. |

## Buyer

Infrastructure providers and enterprises with recurring, high-cost long-context AI workloads.

## Commercial benefit

More eligible work from an existing GPU estate, with evidence and deployment controls attached.

## OPEN BOUNDARY

### Current engineering frontier

Safe generalisation across unfamiliar workload structures is the explicit requirement for the successor compiler. This brief does not claim universal accuracy, production readiness or customer proof.

**Private by design:** organs, routing grammar, thresholds, certificates and source code are not disclosed publicly.
